

30 September 2026

StoreMind AI

The intelligent brain behind the physical store.

StoreMind connects with a retailer's existing systems to understand what is happening in-store, automate routine operations, detect exceptions and help staff act in real time.

THE PROBLEM

34%

Of surveyed Australians had an online order cancelled by the retailer due to stock shortages.

70%

Of those either Abandoned the order or bought elsewhere

The website says four.
The shelf has none.

Sales, returns and misplaced stock can leave digital availability out of step with the store. Staff need time to find the reason before they can fix it.

Example Impact on Myer Stores (see Appendix for Assumptions)

Myer-scale annual impact	Worst	Base	Best
X: Hours saved per year	413	3,300	14,850
Y: Labour cost saved	\$14,339	\$114,708	\$516,186
Z: Order value protected (stockout cancellations avoided)	\$987,500	\$3,950,000	\$11,850,000
Total quantified annual benefit	\$1,001,839	\$4,064,708	\$12,366,186
Annual StoreMind subscription	\$660,000	\$660,000	\$660,000
Benefit / subscription	1.5x	6.2x	18.7x
Payback on Year-1 cost (months)	8.5	2.1	0.7

Source: Grant Thornton, Value, Speed & Reliability (May 2025).

THE SOLUTION

StoreMind makes the shelf and the system agree.

Cameras see what's on the shelf. Store systems know what was sold. StoreMind compares the two in real time.

INPUTS

StoreMind Brain

SEE

Cameras track shelves in real time.

CHECK

AI matches the shelf to sales and stock.

ACT

Staff verify, and records get fixed.

OUTPUTS

Works with the retailer's existing systems. It doesn't replace them.

THE TECHNOLOGY

Under the hood: from shelf camera to staff task.

How the cameras learn

- 1 **Collect.** ~1,000 labelled photos per product, from different angles and lighting.
- 2 **Train.** A detection model learns to recognise each product and count shelf stock.
- 3 **Deploy.** The model runs on an in-store edge device and sends events, not video.
- 4 **Improve.** Every staff check adds new labelled images, so the model keeps retraining.

How StoreMind turns a ghost-stock sale into a two minute staff task

01: Connect

Read-only feeds from sales sources e.g. POS, eCommerce

02: Spot

Flags stock with no sales, repeat failed picks, unrestocked returns and odd adjustments

03: Prioritise

Scores each item: chance the record is wrong x sales speed x online exposure. Buffers online availability while its unverified

04: Verify

Sends a 2 minute task to the nearest staff member: check shelf, display and backroom, then scan a count

05: FIX & LEARN

Corrects the record, updates the listing, triggers replenishment and logs the cause (e.g. misplaced, damaged, theft).

Instead of counting everything every quarter, staff only count what the model flags → fewer stocktake hours, fewer oversold orders.

BUSINESS MODEL

ENTERPRISE SaaS: START WITH ONE RETAILER, SCALE STORE-BY-STORE

Paid 90-day pilot → converts to store-by-store rollout.

Revenue model

\$50K

One-time implementation
fee

\$1K / store / month

Recurring SaaS
subscription

ROI

**~\$4.1M quantified annual
benefit**

6.2x benefit / subscription

Example of Myer-scale deployment

\$710K Year-1 contract

55 stores

\$660K annual subscription + \$50K implementation

*Illustrative base case scenario. Benefit is quantified labour savings + customer order value protected, not guaranteed savings. See Appendix 3 for full 5 year revenue model

A LARGE MARKET WITH A CLEAR PATH TO SCALE

Start with large omnichannel retailers in Australia. Expand across APAC

TAM

A\$173.4M

Australian Inventory Management
Software

*SAM is a proxy based on applying a retail/eCommerce share to the Australian inventory-management software market. SOM is a bottom-up revenue target, not a market forecast

Australian Inventory management software: 8.9% CAGR to 2033

SAM

A\$52.6M

Retail / eCommerce proxy

SOM

A\$3.6M

Year 5 recurring revenue target

COMPETITION

The competition solves pieces of the problem. StoreMind Connects them.

	Physical Sensing	Existing Systems	Cross-System reconciliation	Verification → Action
Manual counts	✓	—	Manual	—
RFID / scanners	✓	Partial	Partial	Partial
Simbe / Trax	✓	✓*	Partial*	✓*
Oracle / SAP	—	✓	✓	✓
StoreMind	✓	✓	✓	✓

*Capabilities vary by product/configuration

LOW FRICTION TO ONBOARD. HIGH VALUE ONCE EMBEDDED.

OUR MOAT: THE INVENTORY INTELLIGENCE LAYER

1. Integration:

More systems connected → higher switching cost

2. Workflow:

Discrepancy → verification → resolution

3. Data:

Every verified discrepancy improves the system

Learning Flywheel

More Stores

More Integrations

More Verified Events

More Operational Data

Better Detection

More ROI

More Stores

Even if individual components can be copied, replacing the complete system becomes increasingly difficult as we integrate deeper into the retailer.

Competitors basically have to ask the retailer to rip out the inventory intelligence layer they've already embedded across their stores and replace it with the competitor's.

It's easy to replace a camera. It's much harder to replace the system connecting the entire inventory ecosystem.

StoreMind AI

Make inventory exceptions easier to find and resolve.

Our ask: a 90-day paid pilot

One store. One product category. Read-only access to your POS, online stock feed and click-and-collect pick-fail logs.

We measure three things: verified inventory accuracy rate, stockout cancellations avoided, and average time to resolve a flagged discrepancy.

If the result holds, we expand store by store.

Appendix 1: Excel Model Summary

StoreMind AI - the AI inventory brain that ends ghost stock

Ignite Their Future: AI Innovation Challenge | Retail | Myer-scale illustrative model. All benefit figures are modelled assumptions, not Myer-reported losses.

Myer-scale annual impact	Worst	Base	Best
X: Hours saved per year	413	3,300	14,850
Y: Labour cost saved	\$14,339	\$114,708	\$516,186
Z: Order value protected (stockout cancellations avoided)	\$987,500	\$3,950,000	\$11,850,000
Total quantified annual benefit	\$1,001,839	\$4,064,708	\$12,366,186
Annual StoreMind subscription	\$660,000	\$660,000	\$660,000
Benefit / subscription	1.5x	6.2x	18.7x
Payback on Year-1 cost (months)	8.5	2.1	0.7

FIVE NUMBERS FOR THE PITCH

Metric	Value	What it is
Myer department stores (FY26 baseline)	56	Anchor customer scale
Myer FY25 online sales	\$758.00m	Reported; the exposure base
Consumers with a stock-cancelled online order	34.0%	Grant Thornton 2026 [3] - confirm
...of those who abandoned or bought elsewhere	70.0%	36% + 34% [3]
Base-case annual quantified benefit	\$4.06m	MODELLED assumption, not a Myer loss

COMPANY MODEL

Year-5 enterprise customers	10
Year-1 revenue	\$820,000
Year-5 revenue	\$3,700,000
Year-5 recurring revenue (ARR)	\$3,600,000
Revenue CAGR Y1-Y5	45.7%
Proxy SAM 2026 (A\$ m)	52.6
Year-5 ARR as share of 2031 SAM	4.5%

Tabs: Assumptions (all inputs) > Time_Saved > ROI_Summary > Financial_Model > Market > Sensitivity > QA_Prep > References

Appendix 2: Assumptions for Example Impact on Myer

1. SCENARIO LEVERS (worst / base / best)							
ID	Assumption	Worst	Base	Best	Unit	Type	Source / rationale
S1	Stocktakes per store per year	1	4	12	per year	Assumption	Base = quarterly. Refs [1] business.gov.au notes stocktakes are commonly done monthly or quarterly (per team research) and are costly/time-consuming.
S2	Reduction in manual stocktake effort from continuous AI reconciliation	25.0%	50.0%	75.0%	% of hours	Assumption	Our judgement. Directional support: Fitness Cartel case ~16 to ~3 labour-hours (~81% cut) [8] - a single vendor case study, so treated as an upper-end example.
S3	Stockout-cancellation rate (share of online orders cancelled because stock did not exist)	0.50%	1.00%	2.00%	% of online orders	Assumption	NO public Myer figure exists. Scenario assumption only. Grant Thornton [3] shows 34% of consumers have had an order cancelled, which is a share of people, not of orders. See Sensitivity tab.
S4	Reduction in stockout cancellations achieved by STOREMIND	25.0%	50.0%	75.0%	% of cancellations	Assumption	Our judgement. Directional support: a 2026 study of ~24,000 SKUs found audits lifted store sales ~11%, concentrated where system stock exceeded real stock [10].

Appendix 3: Fixed Inputs Assumptions

ASSUMPTIONS - single source of truth (change blue cells; every other tab updates)

Colour code: blue = input | black = formula | green = link from another tab | yellow fill = key lever to stress-test. Type: Sourced = from a published source; Benchmark = published example used as a benchmark; Assumption = our judgement, NOT a statistic; Calculated = formula.

2. FIXED INPUTS - Myer scale, labour and online						
ID	Assumption	Value		Unit	Type	Source / rationale
F1	Myer department-store network (FY26 baseline)	56		stores	Sourced	Myer FY26 planning materials [5] (team research). Site says 50+ stores.
F2	Announced closures (Roselands, end July 2026)	1		stores	Sourced	Myer announcement [5] (team research).
F3	Stores modelled	55		stores	Calculated	Inference: 56 less Roselands. Not a Myer-reported final number.
F4	Labour-hours per manual stocktake (one ~4,000-item store)	30		hours	Benchmark	2 people x 15 hours, stocktake provider benchmark [7]. Provider to be named before pitch. Excludes 4-8 h of follow-up recounts, so conservative. Not a Myer number.
F5	Items in benchmark store	4,000		items	Benchmark	Same benchmark [7]. A Myer store carries far more SKUs, so 30 h is likely conservative.
F6	Retail Employee Level 1 adult ordinary rate	\$27.81		\$/hour	Sourced	Fair Work Commission, General Retail Industry Award (MA000004), from 1 Jul 2026 [2].
F7	Casual loading	25.0%		%	Sourced	Fair Work Commission [2].
F8	Level 1 casual hourly rate	\$34.76		\$/hour	Calculated	$27.81 \times 1.25 = \$34.76$, matches Award casual rate [2].
F9	Hours in a working day	8		hours	Assumption	Used only to translate hours into working days.
F10	Myer Retail online sales FY25	\$758,000,000		\$	Sourced	Myer FY25 results [5] (team research): \$758m, 22.9% of sales.
F11	Online sales growth FY26	4.2%		%	Sourced	Myer FY26 results reporting [5] (team research).
F12	FY26 online sales proxy	\$790,000,000		\$	Calculated	Rounded to nearest \$10m (~\$790m). Proxy, NOT a Myer-published FY26 figure.
F13	Average Australian online basket (2025)	\$96		\$	Sourced	Australia Post eCommerce Report 2026 [4]. National average, NOT the Myer basket. Only drives the order count; \$ exposure = online sales x rate, so it does not change the dollar result.

Appendix 4: Customer behaviour, business model & customer growth Assumptions

ASSUMPTIONS - single source of truth (change blue cells; every other tab updates)

Colour code: blue = input | black = formula | green = link from another tab | yellow fill = key lever to stress-test. Type: Sourced = from a published source; Benchmark = published example used as a benchmark; Assumption = our judgement, NOT a statistic; Calculated = formula.

3. CUSTOMER BEHAVIOUR AFTER A STOCKOUT CANCELLATION

ID	Assumption	Value			Unit	Type	Source / rationale
C1	Consumers who have had an online order cancelled (out of stock)	34.0%			% of surveyed consumers	Sourced	Grant Thornton 2026 Australian retail report [3].
C2	...abandoned the purchase altogether	36.0%			% of affected	Sourced	[3]
C3	...bought the product elsewhere	34.0%			% of affected	Sourced	[3]
C4	...bought an alternative from the same retailer	13.0%			% of affected	Sourced	[3]
C5	...bought an alternative elsewhere	10.0%			% of affected	Sourced	[3]
C6	...waited for original retailer stock	7.0%			% of affected	Sourced	[3]
C7	Lost to Myer (abandoned + bought elsewhere)	70.0%			% of affected	Calculated	36% + 34% = 70%. Straight arithmetic on [3].
C8	Check: outcomes sum to 100%	100.0%			%	Calculated	Should equal 100%.

4. BUSINESS MODEL (STOREMIND pricing)

ID	Assumption	Value			Unit	Type	Source / rationale
B1	One-off implementation fee per enterprise customer	\$50,000			\$	Assumption	POS + eCommerce integration, inventory mapping, deployment, training. Team pricing hypothesis, not yet validated with a buyer.
B2	Subscription per store per month	\$1,000			\$	Assumption	Team pricing hypothesis. Sits well below modelled benefit per store (see ROI_Summary).
B3	Average stores per enterprise customer (blended)	30			stores	Assumption	Blend of large chains (Myer-scale, 55) and 10-50 store mid-market chains. Gives \$360k blended ARR per customer.

5. CUSTOMER GROWTH (cumulative enterprise customers)

ID	Assumption	Y1	Y2	Y3	Y4	Y5	Source / rationale
G1	Cumulative enterprise customers	2	4	6	8	10	Assumption: 2 new enterprise customers a year. Australia only; no NZ/APAC revenue and no hardware revenue included.

Appendix 5: Market Size Assumptions

6. MARKET SIZE						
ID	Assumption	Value		Unit	Type	Source / rationale
M1	Australia inventory-management software market, 2026	115.6		US\$ m	Sourced	Grand View Research [6] (team research).
M2	Market CAGR 2026-2033	8.9%		%	Sourced	Grand View Research [6].
M3	Retail/eCommerce share of inventory-software revenue	30.36%		%	Sourced	Global segment share (2025) from a separate dataset [6b]; applied to Australia as a PROXY. Dataset publisher to be named.
M4	Global inventory-management software market, 2026	3,900		US\$ m	Sourced	[6] (team research), ~US\$3.9bn.
M5	A\$ per US\$1 (FX)	1.50		A\$ per US\$	Assumption	PLACEHOLDER - update to the current rate. Needed because the market data is US\$ and our revenue is A\$.

Appendix 6: Time & Labour Saved

X and Y: time and labour saved from stocktake automation (inputs linked to Assumptions tab)

Scenario	Stocktake Frequency per year	Automation Reduction (%)	Store count	Labour Hours per Stocktake	Total Manual Stocktake Hours per year	Hours Saved per year	Hourly Rate (estimate Level 1 casual)	Dollars Saved From Labour
Worst	1	25.0%	55	30	1,650	413	\$34.76	\$14,339
Base	4	50.0%	55	30	6,600	3,300	\$34.76	\$114,708
Best	12	75.0%	55	30	19,800	14,850	\$34.76	\$516,186

Note: Illustrative model based on 55 stores, 30 labour-hours per 4,000-item stocktake, quarterly stocktake frequency and 50% reduction in manual stocktake effort.

Note: This excludes the opportunity cost of employees not serving customers.

Stockout Risk

Estimated Online Sales Revenue	Average Online Basket	Estimated Number of Orders	Scenario	Assumed Stockout Cancellation Rate	Estimated Stockout Value Exposed	Estimated Value Prevented	Scenario	Reduction:
\$790,000,000	\$96	8,229,167	Worst	0.50%	\$3,950,000	\$987,500	Worst	25.0%
\$790,000,000	\$96	8,229,167	Base	1.00%	\$7,900,000	\$3,950,000	Base	50.0%
\$790,000,000	\$96	8,229,167	Best	2.00%	\$15,800,000	\$11,850,000	Best	75.0%

Note: exposure is gross customer order value that could be cancelled/refunded under the assumed rate. It is a modelled figure, not a Myer-reported loss.

Appendix 7: ROI Summary

X + Y + Z: Myer-scale annual benefit vs STOREMIND cost (worst / base / best)

Illustrative model: 55 stores, benchmark labour-hours, assumed cancellation rates. Not a claim about Myer's actual losses.

Metric	Worst	Base	Best	How it is calculated
Stores modelled	55	55	55	Assumptions F3
Stocktakes per store per year	1	4	12	Assumptions S1
Automation reduction in stocktake effort	25.0%	50.0%	75.0%	Assumptions S2
Manual stocktake hours per year	1,650	6,600	19,800	stores x hours x frequency
X: Hours saved per year	413	3,300	14,850	manual hours x automation reduction
equivalent working days saved	52	413	1,856	hours saved / 8
Y: Labour cost saved per year	\$14,339	\$114,708	\$516,186	hours saved x \$34.76 casual rate (excludes lost selling time)
Assumed stockout-cancellation rate	0.50%	1.00%	2.00%	Assumptions S3
Estimated online orders per year	8,229,167	8,229,167	8,229,167	online sales / average basket
Customer order value exposed to cancellation	\$3,950,000	\$7,900,000	\$15,800,000	orders x rate x basket
Reduction in cancellations achieved	25.0%	50.0%	75.0%	Assumptions S4
Z: Order value protected per year	\$987,500	\$3,950,000	\$11,850,000	exposure x reduction
TOTAL quantified annual benefit (Y + Z)	\$1,001,839	\$4,064,708	\$12,366,186	labour saved + order value protected
Annual STOCKBRAIN subscription	\$660,000	\$660,000	\$660,000	stores x \$/store/month x 12
One-off implementation fee	\$50,000	\$50,000	\$50,000	Assumptions B1
Year-1 cost to Myer	\$710,000	\$710,000	\$710,000	subscription + implementation
Benefit / annual subscription	1.5x	6.2x	18.7x	total benefit / subscription
Net ROI on subscription	51.8%	515.9%	1773.7%	(benefit - subscription) / subscription
Payback on Year-1 cost (months)	8.5	2.1	0.7	Year-1 cost / monthly benefit
Break-even: cancellations we must prevent (% of exposure)	16.3%	6.9%	0.9%	(subscription - labour saved) / exposure. Lower = safer.

Appendix 8: Full 5 year revenue model (scenario not forecast)

STOREMIND five-year revenue model (illustrative scenario, not a forecast)

Australia only, enterprise SaaS. No hardware, no international revenue, no cost base modelled. Simplification: customers pay a full year of subscription in the year they sign.

A\$	Y1	Y2	Y3	Y4	Y5
